

# Lecture 2: Image Classification pipeline

# Administrative: Piazza

For questions about midterm, poster session, projects,  
use Piazza instead of staff list!

SCPD students: Use your @stanford.edu address to register for Piazza; contact [scpd-customerservice@stanford.edu](mailto:scpd-customerservice@stanford.edu) for help.

# Administrative: Assignment 1

Out tonight, due 4/18 11:59pm

- K-Nearest Neighbor
- Linear classifiers: SVM, Softmax
- Two-layer neural network
- Image features

# Administrative: Python + Numpy

CS231n Convolutional Neural Networks for Visual Recognition

## Python Numpy Tutorial

This tutorial was contributed by [Justin Johnson](#).

We will use the Python programming language for all assignments in this course. Python is a great general-purpose programming language on its own, but with the help of a few popular libraries (numpy, scipy, matplotlib) it becomes a powerful environment for scientific computing.

We expect that many of you will have some experience with Python and numpy; for the rest of you, this section will serve as a quick crash course both on the Python programming language and on the use of Python for scientific computing.

<http://cs231n.github.io/python-numpy-tutorial/>

# Administrative: Google Cloud

## Google Cloud Tutorial

---

For the class project and assignments, we offer an option to use Google Compute Engine for developing and testing your implementations. This tutorial lists the necessary steps of working on the assignments using Google Cloud. For each assignment, we will provide you with an image containing the starter code and all dependencies that you need to complete the assignment. This tutorial goes through how to set up your own Google Compute Engine (GCE)

<http://cs231n.github.io/gce-tutorial/>

What the computer sees

An image is just a big grid of numbers between [0, 255]:

e.g. 800 x 600 x 3  
(3 channels RGB)

# Challenges: Viewpoint variation

# An image classifier

```
def classify_image(image):  
    # Some magic here?  
    return class_label
```

Unlike e.g. sorting a list of numbers,

**no obvious way** to hard-code the algorithm for recognizing a cat, or other classes.

# Attempts have been made

Find edges

Find corners

John Canny, "A Computational Approach to Edge Detection", IEEE TPAMI 1986

# Data-Driven Approach

1. Collect a dataset of images and labels
2. Use Machine Learning to train a classifier
3. Evaluate the classifier on new images

Example training set

```
def train(images, labels):  
    # Machine learning!  
    return model
```

```
def predict(model, test_images):  
    # Use model to predict labels  
    return test_labels
```

**airplane**

**automobile**

**bird**

**cat**

**deer**

# First classifier: Nearest Neighbor

```
def train(images, labels):  
    # Machine learning!  
    return model
```

Memorize all  
data and labels

```
def predict(model, test_images):  
    # Use model to predict labels  
    return test_labels
```

Predict the label  
of the most similar  
training image

# Example Dataset: CIFAR10

**10** classes

**50,000** training images

**10,000** testing images

**airplane**

**automobile**

**bird**

**cat**

**deer**

**dog**

**frog**

**horse**

**ship**

**truck**

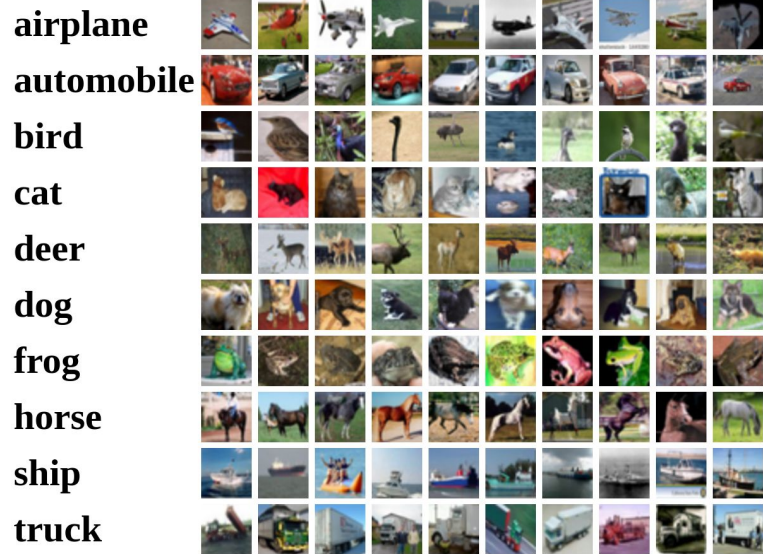

Alex Krizhevsky, "Learning Multiple Layers of Features from Tiny Images", Technical Report, 2009.

# Example Dataset: CIFAR10

10 classes

50,000 training images

10,000 testing images

Test images and nearest neighbors

Alex Krizhevsky, "Learning Multiple Layers of Features from Tiny Images", Technical Report, 2009.

# Distance Metric to compare images

**L1 distance:** 
$$d_1(I_1, I_2) = \sum_P |I_1^P - I_2^P|$$

test image		training image		pixel-wise absolute value differences				
56	32	10	18	46	12	14	1	= $\xrightarrow{\text{add}}$ 456
90	23	128	133	82	13	39	33

            min_index = np.argmin(distances) # get the index with smallest distance
```

```
            Ypred[i] = self.ytr[min_index] # predict the label of the nearest example
```

```
        return Ypred
```

## Nearest Neighbor classifier

**Q:** With N examples, how fast are training and prediction?

```

import numpy as np

class NearestNeighbor:
    def __init__(self):
        pass

    def train(self, X, y):
        """ X is N x D where each row is an example. Y is 1-dimension of size N """
        # the nearest neighbor classifier simply remembers all the training data
        self.Xtr = X
        self.ytr = y

    def predict(self, X):
        """ X is N x D where each row is an example we wish to predict label for """
        num_test = X.shape[0]
        # lets make sure that the output type matches the input type
        Ypred = np.zeros(num_test, dtype = self.ytr.dtype)

        # loop over all test rows
        for i in xrange(num_test):
            # find the nearest training image to the i'th test image
            # using the L1 distance (sum of absolute value differences)
            distances = np.sum(np.abs(self.Xtr - X[i,:]), axis = 1)
            min_index = np.argmin(distances) # get the index with smallest distance
            Ypred[i] = self.ytr[min_index] # predict the label of the nearest example

        return Ypred

```

## Nearest Neighbor classifier

**Q:** With N examples, how fast are training and prediction?

**A:** Train  $O(1)$ ,  
predict  $O(N)$

```
import numpy as np

class NearestNeighbor:
    def __init__(self):
        pass

    def train(self, X, y):
        """ X is N x D where each row is an example. Y is 1-dimension of size N """
        # the nearest neighbor classifier simply remembers all the training data
        self.Xtr = X
        self.ytr = y

    def predict(self, X):
        """ X is N x D where each row is an example we wish to predict label for """
        num_test = X.shape[0]
        # lets make sure that the output type matches the input type
        Ypred = np.zeros(num_test, dtype = self.ytr.dtype)

        # loop over all test rows
        for i in xrange(num_test):
            # find the nearest training image to the i'th test image
            # using the L1 distance (sum of absolute value differences)
            distances = np.sum(np.abs(self.Xtr - X[i,:]), axis = 1)
            min_index = np.argmin(distances) # get the index with smallest distance
            Ypred[i] = self.ytr[min_index] # predict the label of the nearest example

        return Ypred
```

## Nearest Neighbor classifier

**Q:** With N examples, how fast are training and prediction?

**A:** Train  $O(1)$ ,  
predict  $O(N)$

This is bad: we want classifiers that are **fast** at prediction; **slow** for training is ok

# What does this look like?

# K-Nearest Neighbors

Instead of copying label from nearest neighbor, take **majority vote** from K closest points

$K = 1$

$K = 3$

$K = 5$

# What does this look like?

# What does this look like?

# K-Nearest Neighbors: Distance Metric

L1 (Manhattan) distance

$$d_1(I_1, I_2) = \sum_p |I_1^p - I_2^p|$$

L2 (Euclidean) distance

$$d_2(I_1, I_2) = \sqrt{\sum_p (I_1^p - I_2^p)^2}$$

# K-Nearest Neighbors: Distance Metric

L1 (Manhattan) distance

$$d_1(I_1, I_2) = \sum_p |I_1^p - I_2^p|$$

K = 1

L2 (Euclidean) distance

$$d_2(I_1, I_2) = \sqrt{\sum_p (I_1^p - I_2^p)^2}$$

K = 1

# K-Nearest Neighbors: Demo Time

## K-Nearest Neighbors Demo

This interactive demo lets you explore the K-Nearest Neighbors algorithm for classification. Each point in the plane is colored with the class that would be assigned to it using the K-Nearest Neighbors algorithm. Points for which the K-Nearest Neighbor algorithm results in a tie are colored white.

You can move points around by clicking and dragging!

# Hyperparameters

What is the best value of **k** to use?

What is the best **distance** to use?

These are **hyperparameters**: choices about the algorithm that we set rather than learn

# Hyperparameters

What is the best value of **k** to use?

What is the best **distance** to use?

These are **hyperparameters**: choices about the algorithm that we set rather than learn

Very problem-dependent.

Must try them all out and see what works best.

# Setting Hyperparameters

**Idea #1:** Choose hyperparameters  
that work best on the data

Your Dataset

# Setting Hyperparameters

**Idea #1:** Choose hyperparameters that work best on the data

**BAD:**  $K = 1$  always works perfectly on training data

Your Dataset

# Setting Hyperparameters

**Idea #1:** Choose hyperparameters that work best on the data

**BAD:**  $K = 1$  always works perfectly on training data

Your Dataset

**Idea #2:** Split data into **train** and **test**, choose hyperparameters that work best on test data

train

test

# Setting Hyperparameters

**Idea #1:** Choose hyperparameters that work best on the data

**BAD:**  $K = 1$  always works perfectly on training data

Your Dataset

**Idea #2:** Split data into **train** and **test**, choose hyperparameters that work best on test data

**BAD:** No idea how algorithm will perform on new data

train

test

test

# Setting Hyperparameters

Your Dataset

**Idea #4: Cross-Validation:** Split data into **folds**, try each fold as validation and average the results

fold 1	fold 2	fold 3	fold 4	fold 5	test
fold 1	fold 2	fold 3	fold 4	fold 5	test
fold 1	fold 2	fold 3	fold 4	fold 5	test

Useful for small datasets, but not used too frequently in deep learning

# Setting Hyperparameters

Example of  
5-fold cross-validation  
for the value of **k**.

Each point: single  
outcome.

The line goes  
through the mean, bars  
indicated standard  
deviation

(Seems that  $k \approx 7$  works best  
for this data)

# k-Nearest Neighbor on images **never used**.

- Very slow at test time
- Distance metrics on pixels are not informative

Original

Boxed

Shifted

Tinted

(all 3 images have same L2 distance to the one on the left)

Original image is  
CC0 public domain

# k-Nearest Neighbor on images **never used**.

- Curse of dimensionality

# K-Nearest Neighbors: Summary

In **Image classification** we start with a **training set** of images and labels, and must predict labels on the **test set**

The **K-Nearest Neighbors** classifier predicts labels based on nearest training examples

Distance metric and K are **hyperparameters**

Choose hyperparameters using the **validation set**; only run on the test set once at the very end!

# Linear Classification

# Neural Network

Linear  
classifiers

# Recall CIFAR10

airplane

automobile

bird

cat

deer

dog

frog

horse

ship

truck

**50,000** training images  
each image is **32x32x3**

**10,000** test images.

# Parametric Approach

Image

Array of **32x32x3** numbers  
(3072 numbers total)

**10** numbers giving  
class scores

**W**

parameters  
or weights

# Parametric Approach: Linear Classifier

Image

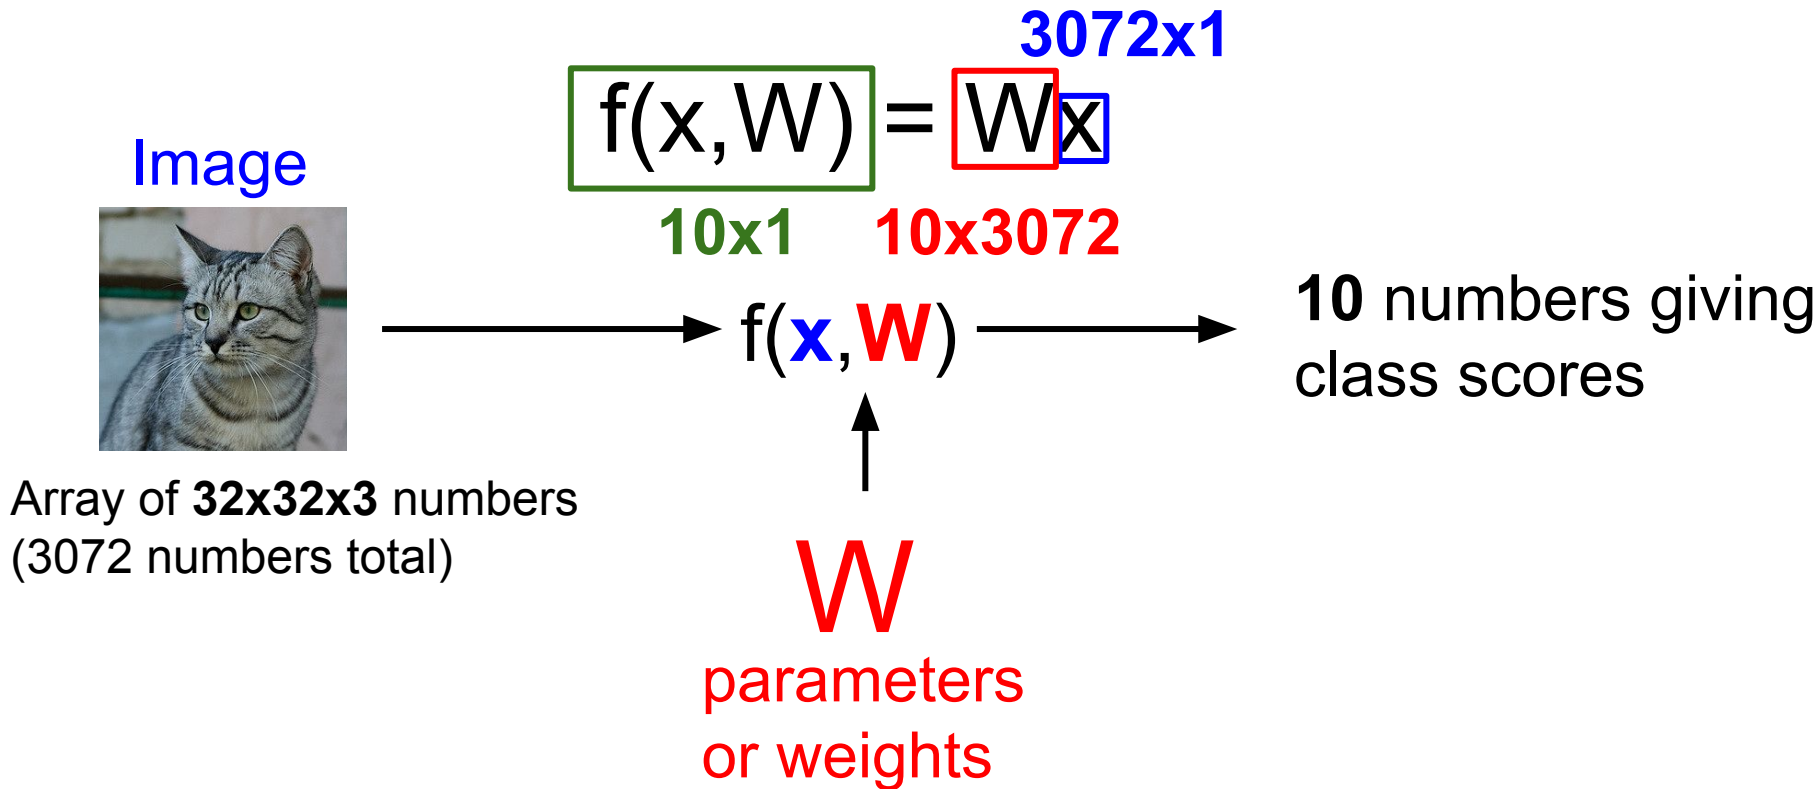

Array of **32x32x3** numbers  
(3072 numbers total)

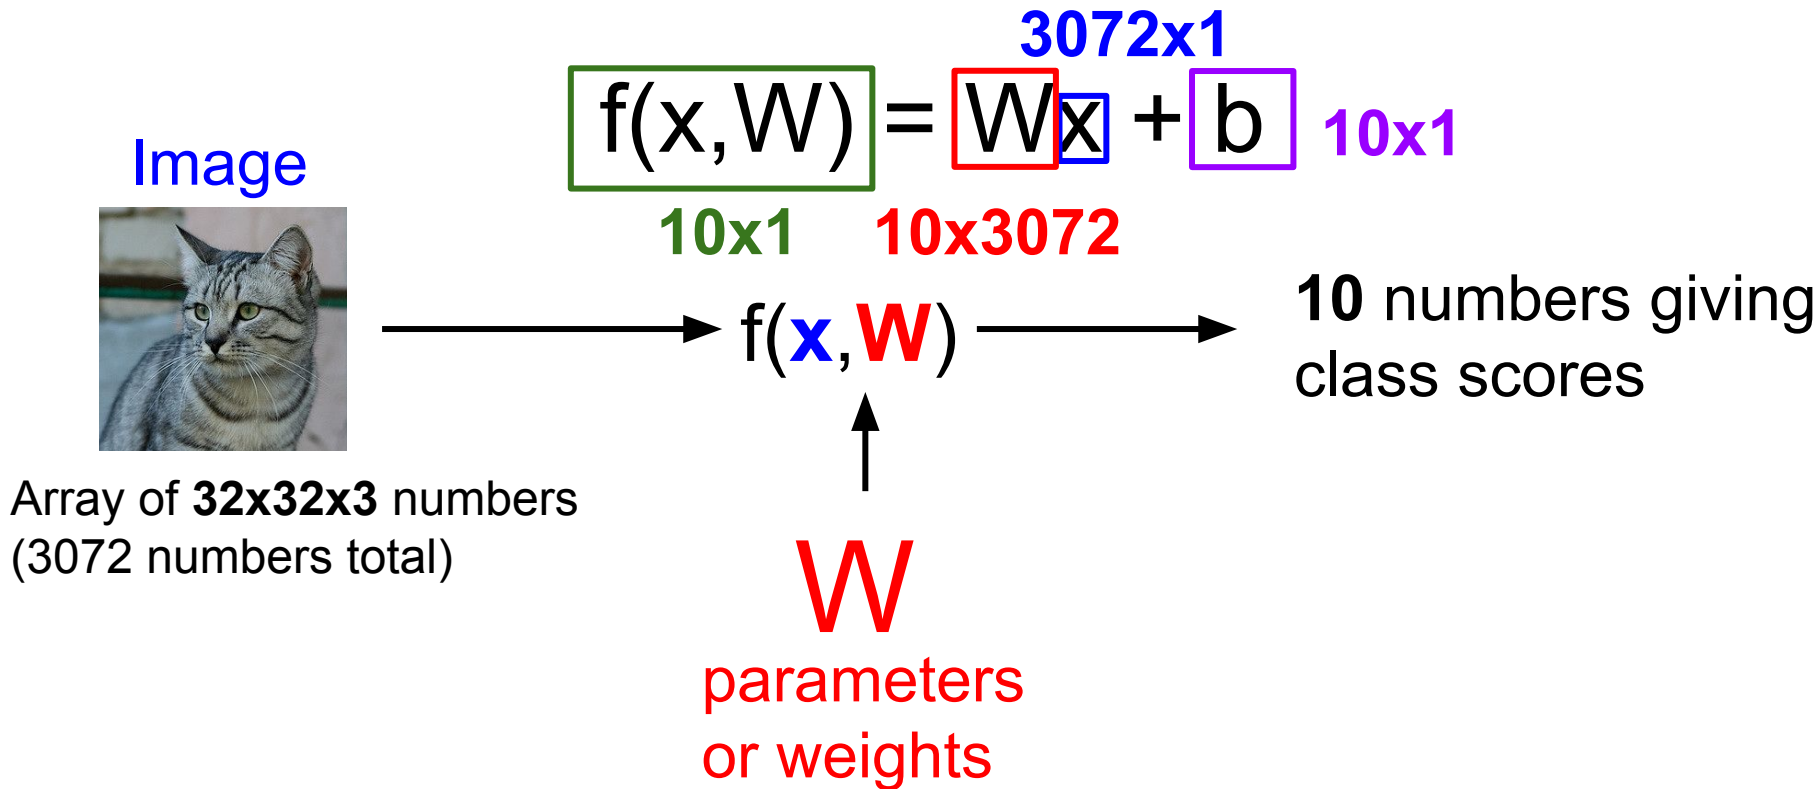

$$f(\mathbf{x}, \mathbf{W}) = \mathbf{W}\mathbf{x}$$

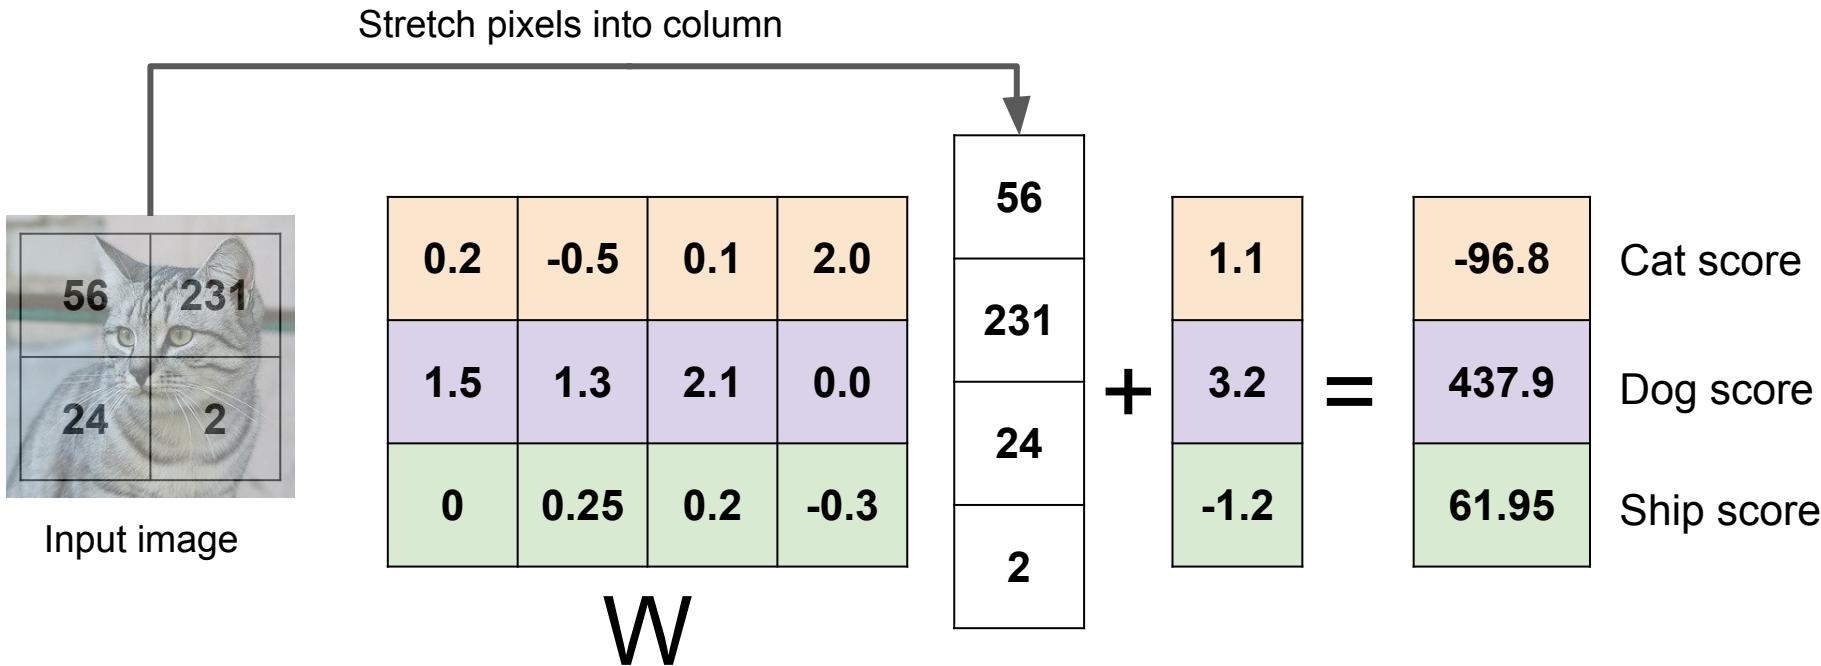

# Parametric Approach: Linear Classifier

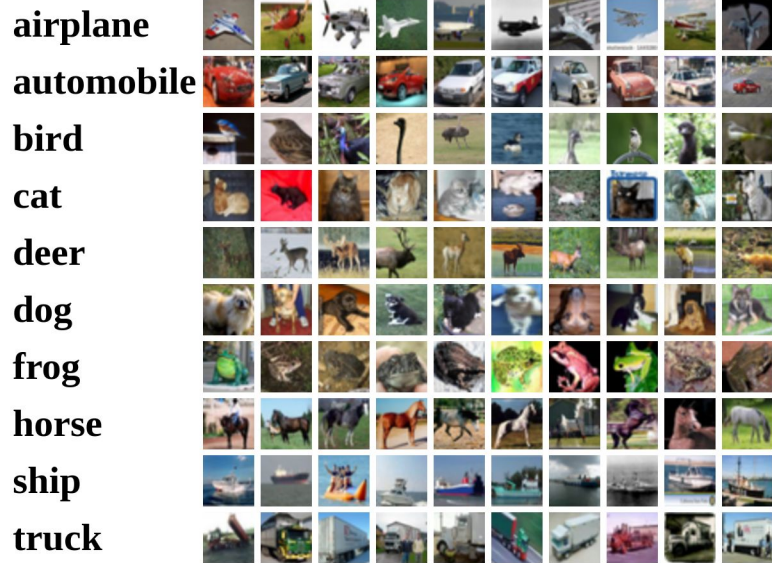

# Parametric Approach: Linear Classifier

# Example with an image with 4 pixels, and 3 classes (cat/dog/ship)

# Interpreting a Linear Classifier

$$f(x, W) = Wx + b$$

What is this thing doing?

# Interpreting a Linear Classifier

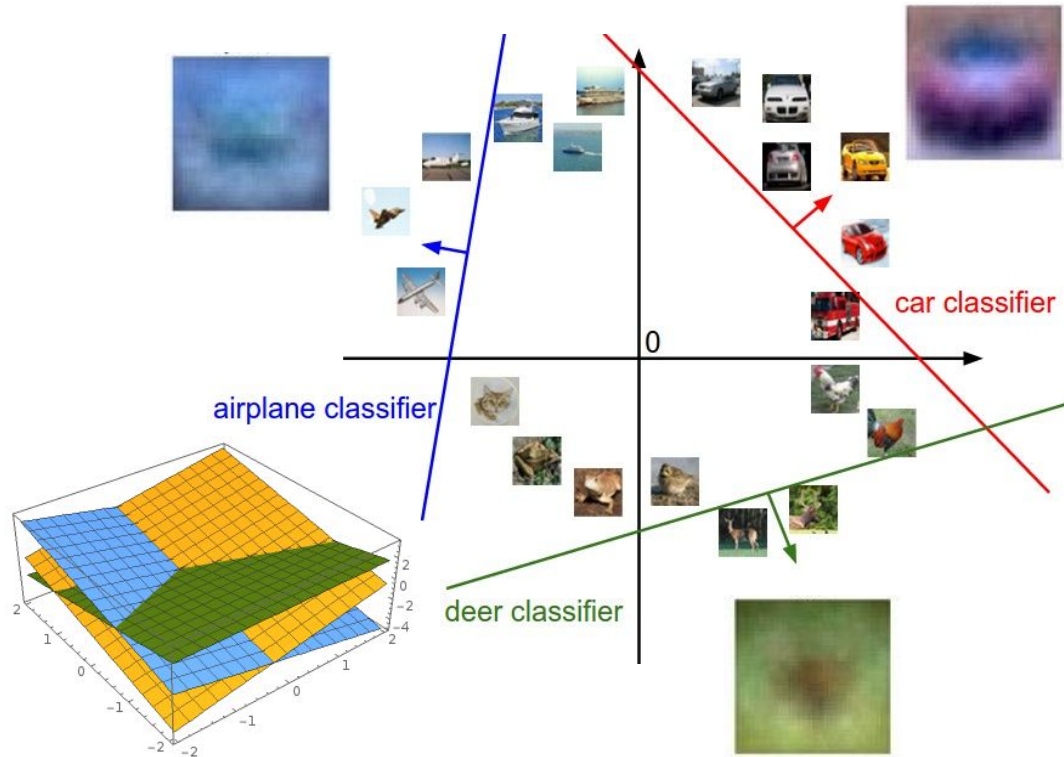

$$f(x, W) = Wx + b$$

Example trained weights  
of a linear classifier  
trained on CIFAR-10:

# Interpreting a Linear Classifier

$$f(x, W) = Wx + b$$

Array of **32x32x3** numbers  
(3072 numbers total)

# Hard cases for a linear classifier

**Class 1:**

number of pixels  $> 0$  odd

**Class 2:**

number of pixels  $> 0$  even

**Class 1:**

$1 \leq \text{L2 norm} \leq 2$

**Class 2:**

Everything else

**Class 1:**

Three modes

**Class 2:**

Everything else

**So far:** Defined a (linear) score function  $f(x,W) = Wx + b$

Example class scores for 3 images for some  $W$ :

How can we tell whether this  $W$  is good or bad?

airplane	-3.45	-0.51	3.42
automobile	-8.87	<b>6.04</b>	4.64
bird	0.09	5.31	2.65
cat	<b>2.9</b>	-4.22	5.1
deer	4.48	-4.19	2.64
dog	8.02	3.58	5.55
frog	3.78	4.49	<b>-4.34</b>
horse	1.06	-4.37	-1.5
ship	-0.36	-2.09	-4.79
truck	-0.72	-2.93	6.14

[Frog image](#) is in the public domain

$$f(x, W) = Wx + b$$

# Coming up:

- Loss function
- Optimization
- ConvNets!

(quantifying what it means to have a “good”  $W$ )

(start with random  $W$  and find a  $W$  that minimizes the loss)

(tweak the functional form of  $f$ )
