Lecture 5: Image Classification with CNNs

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 1 April 16, 2024

Administrative

Assignment 1 due Friday April 19, 11:59pm

- Important: tag your solutions with the corresponding hw question in gradescope!

Assignment 2 will also be released on April 19

Lecture 5 - 2 April 16, 2024

Administrative Project proposal due Monday Apr 22, 11:59pm

Discuss with TA mentors: Canvas -> our course -> People -> Groups

Final TA mentor: assigned based on the topic after proposal

Section on Friday will discuss the final project guidelines

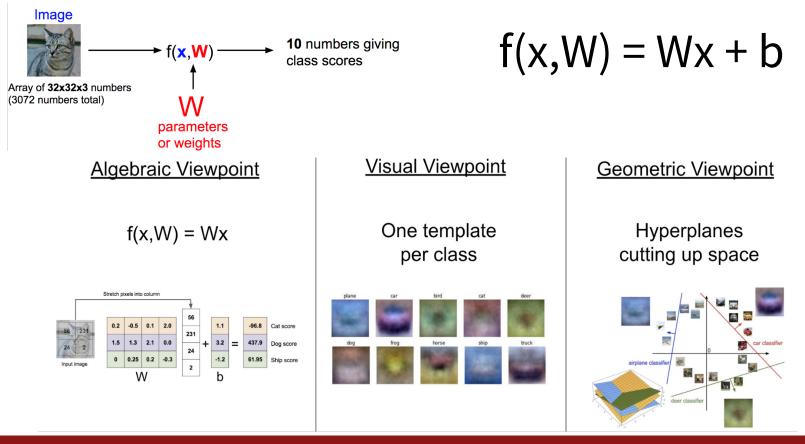

Administrative

Lectures 6 & 7 will be video-recorded, next session we will go over the summaries and will do Q/A (to allow for more time for newer content in the second half of the quarter)

Canvas -> our course -> Panopto Course Videos

Lecture 5 - 4 April 16, 2024

Recap: Image Classification with Linear Classifier

Fei-Fei Li, Ehsan Adeli

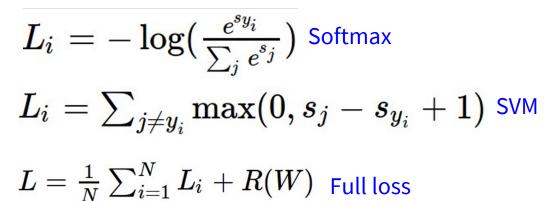

Lecture 5 - 5

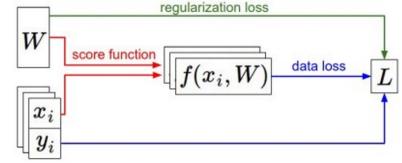

April 16, 2024

Recap: Loss Function

- We have some dataset of (x,y)
- We have a score function:
- We have a loss function:

$$s=f(x;W)=Wx$$

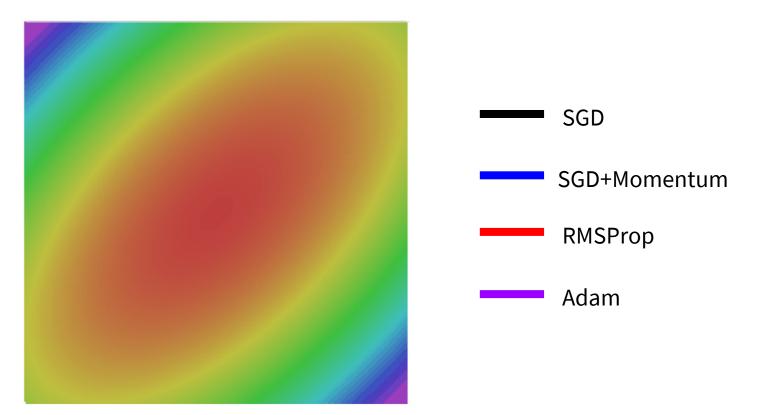

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 6 April 16, 2024

Recap: Optimization

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 7 April 16, 2024

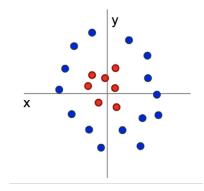

Problem: Linear Classifiers are not very powerful

Visual Viewpoint

Linear classifiers learn one template per class

Geometric Viewpoint

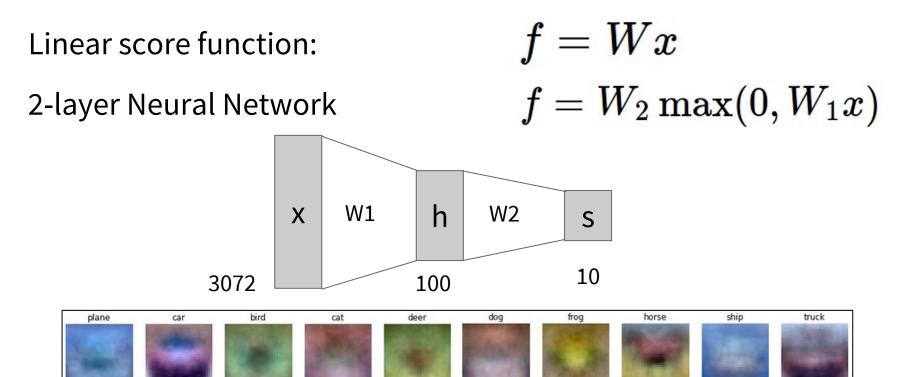

Linear classifiers can only draw linear decision boundaries

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 8 April 16, 2024

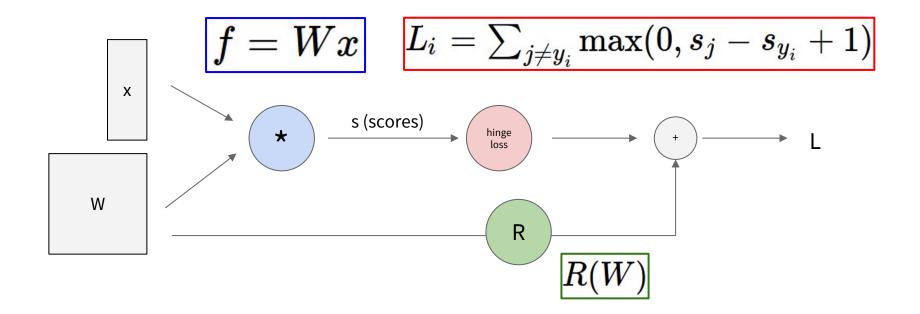

Last time: Neural Networks

Fei-Fei Li, Ehsan Adeli

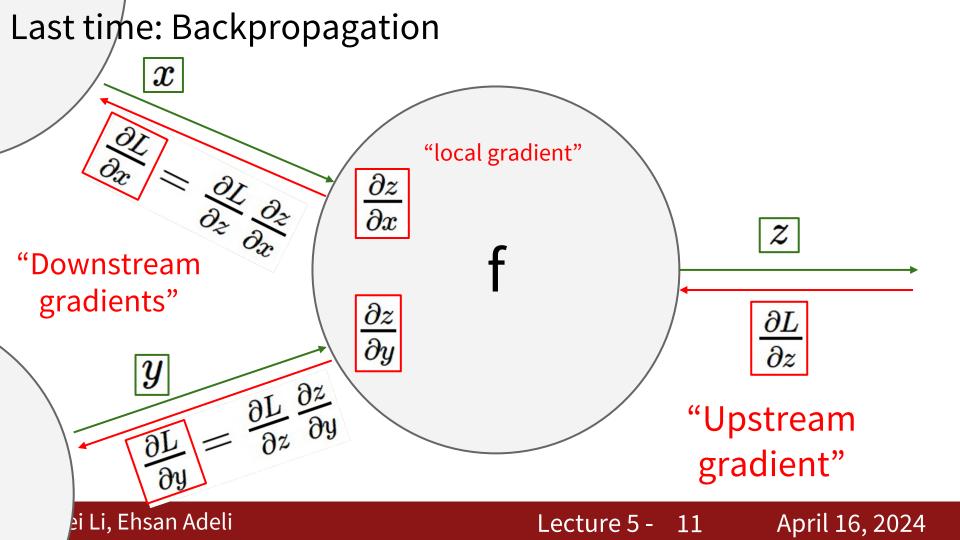

Lecture 5 - 9 April 16, 2024

7x7 input (spatially) assume 3x3 filter applied with stride 3?

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 80 April 16, 2024

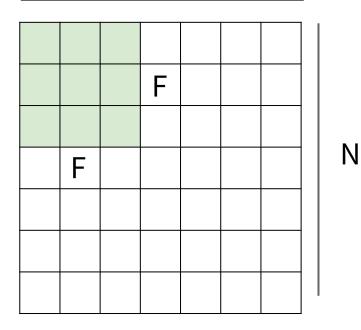

7x7 input (spatially) assume 3x3 filter applied with stride 3?

doesn't fit! cannot apply 3x3 filter on 7x7 input with stride 3.

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 81 April 16, 2024

Ν

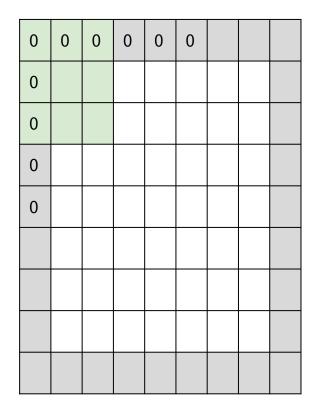

Output size: (N - F) / stride + 1

Lecture 5 - 82

April 16, 2024

Fei-Fei Li, Ehsan Adeli

In practice: Common to zero pad the border

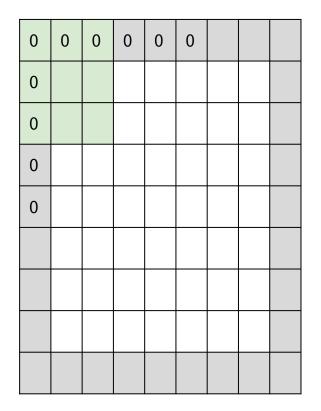

e.g. input 7x7 3x3 filter, applied with stride 1 pad with 1 pixel border => what is the output?

> (recall:) (N - F) / stride + 1

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 83 April 16, 2024

In practice: Common to zero pad the border

e.g. input 7x7 3x3 filter, applied with stride 1 pad with 1 pixel border => what is the output?

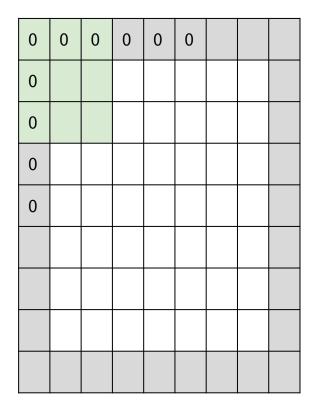

7x7 output!

(recall:) (N + 2P - F) / stride + 1

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 84 April 16, 2024

In practice: Common to zero pad the border

e.g. input 7x7 3x3 filter, applied with stride 1 pad with 1 pixel border => what is the output?

7x7 output!

in general, common to see CONV layers with stride 1, filters of size FxF, and zero-padding with (F-1)/2. (will preserve size spatially) e.g. F = 3 => zero pad with 1 F = 5 => zero pad with 2 F = 7 => zero pad with 3

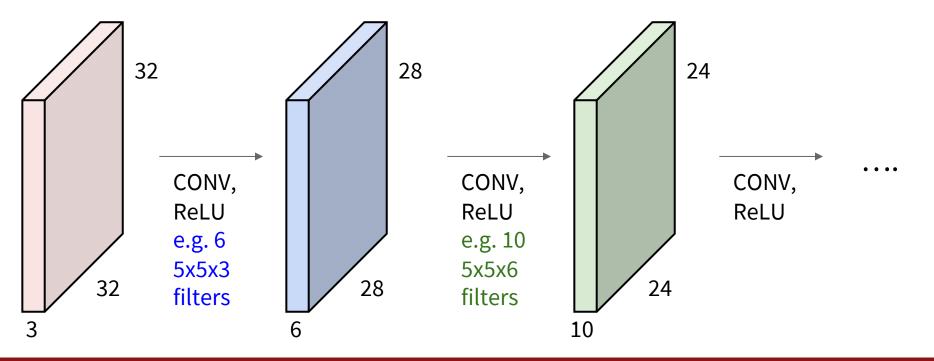

Lecture 5 - 85

April 16, 2024

Fei-Fei Li, Ehsan Adeli

Remember back to...

E.g. 32x32 input convolved repeatedly with 5x5 filters shrinks volumes spatially! (32 -> 28 -> 24 ...). Shrinking too fast is not good, doesn't work well.

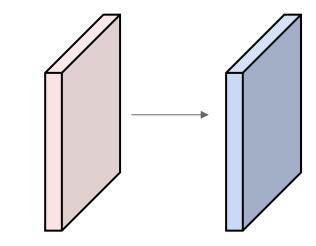

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 86

April 16, 2024

Output volume size: ?

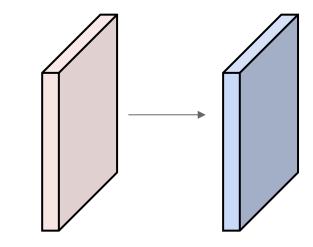

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 87 April 16, 2024

Examples time:

Output volume size: (32+2*2-5)/1+1 = 32 spatially, so 32x32x10

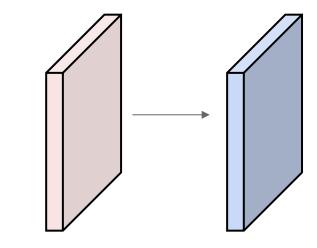

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 88 April 16, 2024

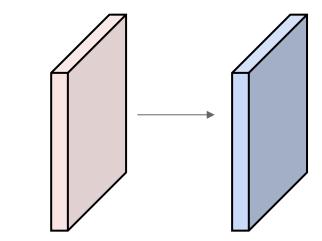

Number of parameters in this layer?

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 89 April 16, 2024

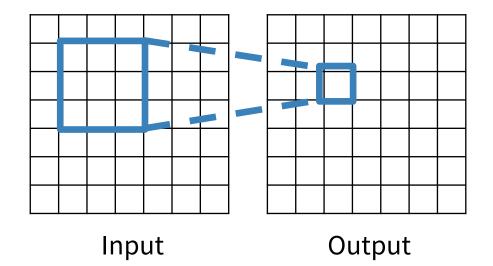

Examples time:

Number of parameters in this layer? each filter has 5*5*3 + 1 = 76 params (+1 for bias) => 76*10 = 760

Lecture 5 - 96 April 16, 2024

Convolution layer: summary

Let's assume input is W₁ x H₁ x C Conv layer needs 4 hyperparameters:

- Number of filters K
- The filter size F
- The stride S
- The zero padding P

This will produce an output of $W_2 \times H_2 \times K$ where:

- $W_2 = (W_1 F + 2P)/S + 1$
- $H_2 = (H_1 F + 2P)/S + 1$

Number of parameters: F²CK and K biases

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 97 April 16, 2024

Convolution layer: summary

Let's assume input is W₁ x H₁ x C Conv layer needs 4 hyperparameters:

- Number of filters K
- The filter size F
- The stride S
- The zero padding P

This will produce an output of W₂ x H₂ x K where:

- $W_2 = (W_1 F + 2P)/S + 1$
- $H_2 = (H_1 F + 2P)/S + 1$

Number of parameters: F²CK and K biases

Common settings:

K = (powers of 2, e.g. 32, 64, 128, 512)

-
$$F = 5, S = 1, P = 2$$

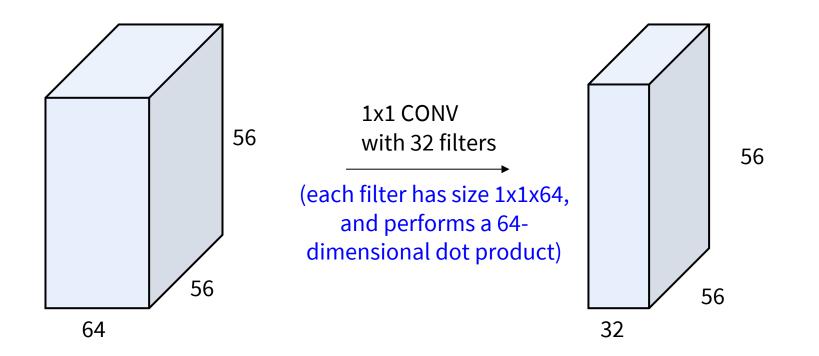

- F = 5, S = 2, P = ? (whatever fits)
- F = 1, S = 1, P = 0

Lecture 5 - 100 April 16, 2024

Example: CONV layer in PyTorch

Conv layer needs 4 hyperparameters:

- Number of filters K
- The filter size F
- The stride S
- The zero padding P

Conv2d

CLASS torch.nn.Conv2d(in_channels, out_channels, kernel_size, stride=1, padding=0, dilation=1, groups=1, bias=True)

[SOURCE]

Applies a 2D convolution over an input signal composed of several input planes.

In the simplest case, the output value of the layer with input size $(N,C_{\rm in},H,W)$ and output $(N,C_{\rm out},H_{\rm out},W_{\rm out})$ can be precisely described as:

$$ext{out}(N_i, C_{ ext{out}_j}) = ext{bias}(C_{ ext{out}_j}) + \sum_{k=0}^{C_{ ext{in}}-1} ext{weight}(C_{ ext{out}_j}, k) \star ext{input}(N_i, k)$$

where \star is the valid 2D cross-correlation operator, N is a batch size, C denotes a number of channels, H is a height of input planes in pixels, and W is width in pixels.

- stride controls the stride for the cross-correlation, a single number or a tuple.
- padding controls the amount of implicit zero-paddings on both sides for padding number of points for each dimension.
- dilation controls the spacing between the kernel points; also known as the à trous algorithm. It is harder to
 describe, but this link has a nice visualization of what dilation does.
- groups controls the connections between inputs and outputs. in_channels and out_channels must both be divisible by groups. For example,
 - At groups=1, all inputs are convolved to all outputs.
 - At groups=2, the operation becomes equivalent to having two conv layers side by side, each seeing half the input channels, and producing
 - half the output channels, and both subsequently concatenated.
 - At groups= in_channels, each input channel is convolved with its

own set of filters, of size: $\frac{C_{\text{out}}}{C_{\text{in}}}$

The parameters kernel_size, stride, padding, dilation can either be:

- a single int in which case the same value is used for the height and width dimension
- a tuple of two ints in which case, the first int is used for the height dimension, and the second int for the width dimension

April 16, 2024 Lecture 5 - 103

The brain/neuron view of CONV Layer

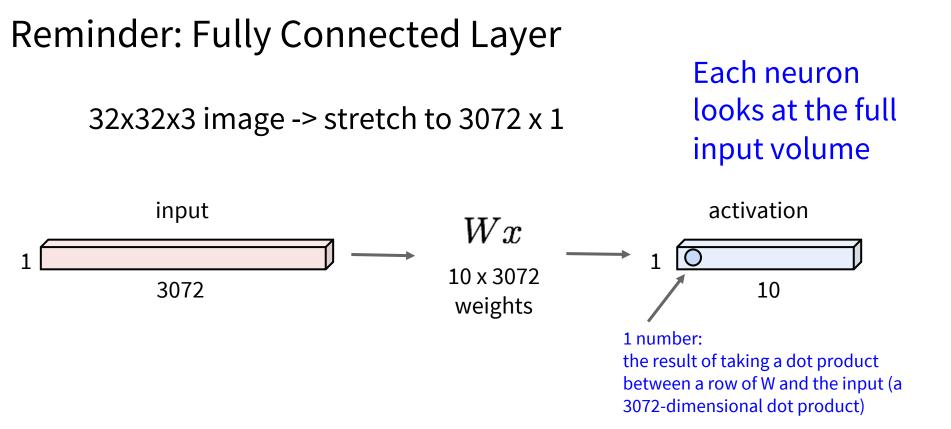

E.g. with 5 filters, CONV layer consists of neurons arranged in a 3D grid (28x28x5)

There will be 5 different neurons all looking at the same region in the input volume

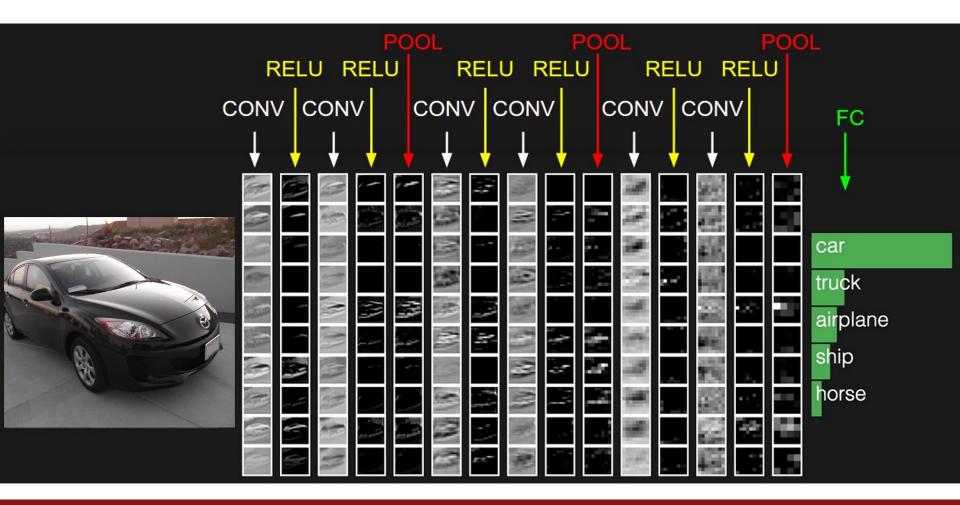

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 104 April 16, 2024

Lecture 5 - 106 April 16, 2024

Pooling layer

- makes the representations smaller and more manageable
- operates over each activation map independently

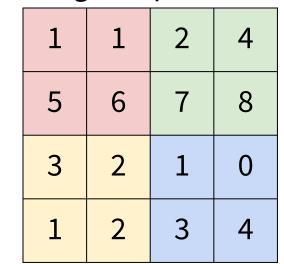

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 107 April 16, 2024

MAX POOLING

Single depth slice

y

max pool with 2x2 filters and stride 2

6	8
3	4

Х

Lecture 5 - 108 April 16, 2024

MAX POOLING

Single depth slice

У

max pool with 2x2 filters and stride 2

- No learnable parameters
- Introduces spatial invariance

Fei-Fei Li, Ehsan Adeli

Х

Lecture 5 - 109 April 16, 2024

Pooling layer: summary

Let's assume input is W₁ x H₁ x C Conv layer needs 2 hyperparameters:

- The spatial extent F
- The stride S

This will produce an output of $W_2 \times H_2 \times C$ where:

April 16, 2024

Lecture 5 - 110

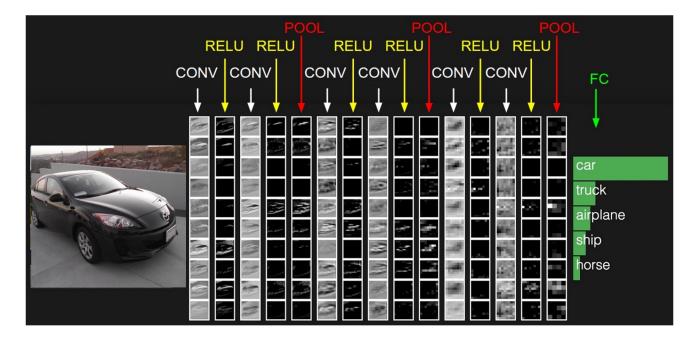

- $W_2 = (W_1 F)/S + 1$
- $H_2 = (H_1 F)/S + 1$

Number of parameters: 0

Fei-Fei Li, Ehsan Adeli

Fully Connected Layer (FC layer)

- Contains neurons that connect to the entire input volume, as in ordinary Neural Networks

Fei-Fei Li, Ehsan Adeli

Lecture 5 - 111 April <u>16, 2024</u>

[ConvNetJS demo: training on CIFAR-10]

ConvNetJS CIFAR-10 demo

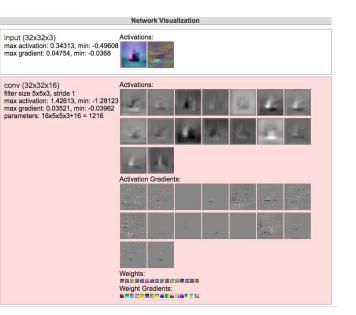

Description

This demo trains a Convolutional Neural Network on the <u>CIFAR-10 dataset</u> in your browser, with nothing but Javascript. The state of the art on this dataset is about 90% accuracy and human performance is at about 94% (not perfect as the dataset can be a bit ambiguous). I used <u>this python script</u> to parse the <u>original files</u> (python version) into batches of images that can be easily loaded into page DOM with img tags.

This dataset is more difficult and it takes longer to train a network. Data augmentation includes random flipping and random image shifts by up to 2px horizontally and verically.

By default, in this demo we're using Adadelta which is one of per-parameter adaptive step size methods, so we don't have to worry about changing learning rates or momentum over time. However, I still included the text fields for changing these if you'd like to play around with SGD+Momentum trainer.

Report questions/bugs/suggestions to @karpathy.

Lecture 5 - 112 April 16, 2024

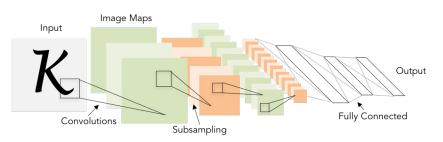

Summary

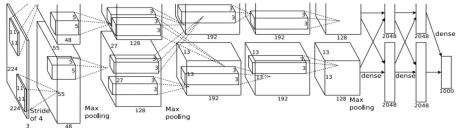

- ConvNets stack CONV,POOL,FC layers
- Trend towards smaller filters and deeper architectures
- Trend towards getting rid of POOL/FC layers (just CONV)
- Historically architectures looked like [(CONV-RELU)*N-POOL?]*M-(FC-RELU)*K,SOFTMAX where N is usually up to ~5, M is large, 0 <= K <= 2.
- But recent advances such as ResNet/GoogLeNet have challenged this paradigm
